Project 3 Retrospective

We have accomplished mash up three websites which was our goal for this project. During the process, our group encountered some problems relating to open API. Hence, the original plan which was using Trivago, Yelp and Uber is replaced by Waynaut, Barchick, and Music Festival Wizards. Although we changed the websites, we still met our expectation at the beginning. After the user evaluation, we found it very useful. According to the evaluation, we updated our design and make it more professional.

Samuel was in charge of website functionality throughout the project. Patrick was in charge of the User Interface and Graphics. Chau was in charge of the user study and the reports of each deliverable. However, during the process, we helped each other if needed which helps the collaboration between the members goes on really well. Thus, we agree with the multipliers of 1.0 for each of us.

For our website, there are 4 buttons on the top: Input, Transportation, Nightlife and Music Festivals. For Input, you will enter any of the location from anywhere in the US and Europe as the origin city and origin country. Since this website only used to find flights to the Europe, so the destination city and destination country will only take Europe locations. For example, origin city: Houston, origin country: USA, destination city: Milan, and destination country: Italy. You will input the date that you want to travel and how many people are going to travel. One last thing to input is the genre of music that you like and select options from the option box on your left as for your convenience.The "Transportation" button will connect to Waynaut, "Nightlife" will connect to Barchick, and Music Festivals will connect to Music Festivals Wizards

This is the contact information of the members that will be available.
